Retail Sales & Inventory Intelligence Dashboard

1. Background

A small retail business needs a clearer understanding of its sales performance, product profitability and inventory levels.

2. Problem statement

The business lacks a consolidated view of its sales and inventory information, making it difficult to identify top-performing products, monitor profitability and determine which products require restocking.

3. Project objective

To develop a business intelligence dashboard that summarises sales performance, highlights product trends and flags products whose stock has reached or fallen below their reorder levels.

4. Stakeholders

- Business owner
- Sales manager
- Inventory manager

5. Scope

The project will include data preparation, basic SQL analysis, an interactive Power BI dashboard, requirements documentation and testing.

6. Expected outcome

A dashboard and supporting documentation that help management interpret business performance and make informed stock-planning decisions.

7. Data limitation

The project will use simulated retail data for demonstration purposes. Findings will not represent an actual business.
